Concise Bash: For those who know it, but sometimes need a memory jogger.

Shell:

- Single quotes = literal. Nothing expanded.
- Double quotes = expanded.
- Backticks = evaluate the expression in here (echo `pwd` is equal to pwd)
- vars (case sensitive!):
 - o test="Hello world"
 - \$test expands the variable. Encase in double quotes if there can be spaces inside, as it can break commands

cat file1 file2 fileN:

Prints files to stdout

chmod [opts] file:

- Numeric mode: <u>U</u>ser<u>G</u>roup<u>A</u>ll read (4) write (2) execute (1)
 - EG: chmod 755 file == owner rwx, group rx, all rx
- Symbolic mode, defaults to all:
 - o <u>u</u>ser, <u>group</u>, <u>o</u>utside group (rarely used), <u>a</u>ll
 - o <u>read</u>, <u>write</u>, execute (others unimportant)
 - Directory: Execute means you can traverse, read means you can Is
 - + to add, to remove, = to be those perms and only those perms
 - EG: chmod =rwx, g+r, u+x file Everyone rwx, group +r, owner +x

cp [-r] SOURCE DESTINATION:

• -r: if a directory is to be copied, copy it and everything inside it

cut [-f -d] file :

- -f: comma separated list of fields, 1 indexed. EG: -f1, 4 (note **no spaces**)
- -d: specify the delimiter EG: -d '' for space separated data.

grep [opt] [search] file:

- -v inverts matches
- Regex:
 - o ^, \$: start of line, end of line respectively
 - o \: escape a character
 - o []: match *anything* inside the brackets, can use range eg [0-9]
 - o [^]: match anything but what's inside
 - o . (period): any character If you want a literal dot, escape it!
 - * 0 or more chars. Greedy. If preceded by a token (eg: a group) will match that instead of anything

head [-n X] file:

- Display the first 10 lines of the file (ie. -n 10)
- -n x (or -x): Display the first X lines of the file.
 - \circ When using -n, some versions of head allow X to be a negative number, ie -n -x, which will result in all except the *last X lines* being printed.

ln [-s] TARGET LINK NAME:

- By default makes a hard link, cannot use this for directories as it breaks the tree!
- -s : symbolic link, for directories and files.

ls [-ladi] directory :

- -a: all files (include files starting with a dot)
- -1: Long format: Permissions, link count, owner, group, filesize, modified time, name
- -d: don't dereference symlinks
- -i : print the index number (inode) of each file

mv SOURCE DESTINATION

<u>ps</u> [-ef]:

- -e : Show all processes
- −f : full format

rm [-rf] file :

- Delete stuff
- -r: recurse through any directories specified for deletion, removing all inner contents
- -f: ignore nonexistent files, never prompt for deletion

rmdir directory :

• Removes an empty directory. Won't do anything if the directory has files/folders!

sort [-r -k] file :

- -r: reverse (normally ascending, changes to descending)
- -k sort by key (origin 1). Columns chosen by blank to non blank transition

svn [commit add remove move update info log status diff] :

- commit: will open the default editor for commit message, or supply -m to skip
- move: SRC DEST
- update: syncs local sandbox with the server. If you have made local changes, it will try and merge any changes on the server with your changes on your machine
- info: stats and stuff for your repo
- log: commit log, may be out of date if you've yet to update
- status: What files have what status, ? = untracked, M modified, A added, D deleted, others not really needed for 2310

tail [-n N] file:

- Show the last 10 lines in the file (ie. -n 10)
- -n x (or -x): Display the last X lines of the file.
 - When using -n, some versions of tail allow X to be a positive number, ie -n +X, which will result in all except the *first X lines* being printed. When using -n, X is interpreted as **negative by default**.

uniq [-c] file :

- Ditches duped lines as they come. Make sure to sort first if you want global uniqueness
- -c: prefix lines with their count

<u>wc</u> [-1] file:

- Default output: newline, word, bytes, filename
- -1 : Count newlines only, filename column is still there!

```
grep [options] PATTERN [FILE...]
grep [options] [-e PATTERN | -f FILE] [FILE...]
Grep searches the named input FILEs (or standard input if no files are named, or the file name - is given) for lines containing a match to the given PATTERN. By default, grep prints the matching lines.
```

CSSE2310 Important Bash Commands sheet [Chat]

UQAttic

- Report or filter out repeated lines in a file

uniq [-c | -d | -u] [-i] [-f num] [-s chars] [input_file [output_file]]
The uniq utility reads the specified input_file comparing adjacent lines,
and writes a copy of each unique input line to the output_file. If
input_file is a single dash ('-') or absent, the standard input is read.
output_file is absent, standard output is used for output. The second
and succeeding copies of identical adjacent input lines are not written. Repeated lines in the input will not be detected if they are not adjacent, so it may be necessary to sort the files first.

Precede each output line with the count of the number of times the line occurred in the input, followed by a single space.

cat - Concatenate and print files

cat [-benstuv] [file ...]
The cat utility reads files sequentially, writing them to the standard output. The file operands are processed in command-line order. If file is a single dash ('-') or absent, cat reads from the standard input. If file is a UNIX tdomain socket, cat connects to it and then reads it until EOF. This complements the UNIX domain binding capability available in inetd(8).

- Display first lines of a file

head [-n count | -c bytes] [file ...]
This filter displays the first count lines or bytes of each of the specified files, or of the standard input if no files are specified. If count is omitted it

defaults to 10.

If more than a single file is specified, each file is preceded by a header consisting of the string ``==> XXX <=='' where ``XXX'' is the name of the file.

negative n counts back from the last line

- Display the last part of a file

tail [-F | -f | -r] [-q] [-b number | -c number | -n number] [file \dots] The tail utility displays the contents of file or, by default, its standard input, to the standard output.

The display begins at a byte, line or 512-byte block location in the input. Numbers having a leading plus (`+') sign are relative to the beginning of the input, for example, ``-c +2'' starts the display at the

- List directory contents

Is [-ABCFGHLOPRSTUM@abcdefghiklmnopqrstumx1] [file ...] each operand that names a file of a type other than directory, ls displays its name as well as any requested, associated information. For each operand that names a file of type directory, ls displays the names of files contained within that directory, as well as any requested, associated information.

If no operands are given, the contents of the current directory are displayed. If more than one operand is given, non-directory operands are displayed first; directory and non-directory operands are sorted separately and in lexicographical order.

List in $\underline{\mathbf{l}}$ ong format. In terminal, total sum of file sizes displayed before

Include directory entries whose names begin with a dot (.). $\underline{\textbf{D}} \text{irectories are listed as plain files (not searched recursively)}.$ For each file, print the file's file serial number ($\underline{\textbf{i}} \text{node number}$).

- Process status ps

The ps utility displays a header line, followed by lines containing information about all of your processes that have controlling terminals.

Display information about other users' processes, including those

without controlling terminals.

Display the uid, pid, parent pid, recent CPU usage, process start time, controlling tty, elapsed CPU usage, and the associated command. If the -u option is also used, display the user name rather then the numeric uid.

- Sort lines of text files sort

```
sort [OPTION]... [FILE]..
```

Write sorted concatenation of all FILE(s) to standard output.

 $\underline{\mathbf{r}}$ everse the result of comparisons

--key=POS1[,POS2] start at POS1 and end at POS2 filter out duplicate lines

CSSE2310 Important Bash Commands sheet [Chat]

UQAttic

second byte of the input. Numbers having a leading minus (`-') sign or no explicit sign are relative to the end of the input, for example, ``-n 2'' displays the last two lines of the input. The default starting location is `'-n 10'', or the last 10 lines of the input.

cut - Cut out selected portions of each line of a file

```
cut -b list [-n] [file ...]
cut -c list [file ...]
cut -f list [-d delim] [-s] [file ...]
```

The cut utility cuts out selected portions of each line (as specified by list) from each file and writes them to the standard output. If no file arguments are specified, or a file argument is a single dash ('-'), cut reads from the standard input. The items specified by list can be in terms of column position or in terms of fields delimited by a special character. Column numbering starts from 1.

The list option argument is a comma or whitespace separated set of num-The list option argument is a comma or whitespace separated set of numbers and/or number ranges. Number ranges consist of a number, a dash ('-'), and a second number and select the fields or columns from the first number to the second, inclusive. Numbers or number ranges may be preceded by a dash, which selects all fields or columns from 1 to the last number. Numbers or number ranges may be followed by a dash, which selects all fields or columns from the last number to the end of the line. Numbers and number ranges may be repeated, overlapping, and in any order. If a field or column is specified multiple times, it will appear only once in the output. It is not an error to select fields or columns not present in the input line.

-f list The list specifies fields, separated in the input by the field delimiter character (see the -d option.) Output fields are sepa rated by a single occurrence of the field delimiter character.

Use delim as the field delimiter character instead of the tab character. -d <u>delim</u>

- Word, line, character, and byte count

wc [-clmw] [file ...]

The wc utility displays the number of lines, words, and bytes contained in each input file, or standard input (if no file is specified) to the standard output. A line is defined as a string of characters delimited by a <newline> character. Characters beyond the final <newline> character will not be included in the line count.

A word is defined as a string of characters delimited by white space A most is defined as a string of climators are the set of characters. White space characters are the set of characters for which the iswspace(3) function returns true. If more than one input file is specified, a line of cumulative counts for all the files is displayed on separate line after the output for the last file.

The number of lines in each input file is written to the standard output.

diff - Compare files line by line

```
diff [OPTION]... FILES
```

- Subversion command line client tool

```
syn command [options] [args]
```

```
commit (ci)
```

 $\hbox{\it commit [PATH...]} \qquad \hbox{\it Send changes from your working copy to the repository}.$

add

add PATH... Put files and directories under version control, scheduling them for addition to repository. They will be added in next commit.

```
delete (del, remove, rm)
```

Each item specified by a PATH is scheduled for deletion upon delete PATH... the next commit. Files, and directories that have not been committed, are immediately removed from the working copy unless the --keep-local option is given. PATHs that are, or contain, unversioned or modified items will not be removed unless the --force option is given. delete URL... Each item specified by a URL is deleted from the repository via an immediate commit.

move (mv, rename, ren)

move SRC... DST Move and/or rename something in working copy or repository. When moving multiple sources, they will be added as children of DST, which must be a directory.

CSSE2310 Important Bash Commands sheet [Chat]

UQAttic

UQAttic

paths. OLD-TGT and NEW-TGT may be working copy paths or URL[@REV]. NEW-TGT defaults to OLD-TGT if not specified. -r N makes OLDREV default to N, -r N:M makes OLDREV default to N and NEWREV default to M.

diff OLD-URL[@OLDREV] NEW-URL[@NEWREV]
Shorthand for 'svn diff --old=OLD-URL[@OLDREV] --new=NEW-URL[@NEWREV]'

Use just 'svn diff' to display local modifications in a working copy.

chmod - Change file modes or Access Control Lists

```
chmod [-fv] [-R [-H | -L | -P]] mode file ...
chmod [-fv] [-R [-H | -L | -P]] [-a | +a | =a] ACE file ...
chmod [-fv] [-R [-H | -L | -P]] [-E] file ...
chmod [-fhv] [-R [-H | -L | -P]] [-C] file ...
chmod [-fhv] [-R [-H | -L | -P]] [-N] file ...
```

who ::= a | u | g | o
The who symbols ``u'', ``g'', and ``o'' specify the user, group, and
other parts of the mode bits, respectively. The who symbol ``a'' is equivalent to ``ugo''.

::= + | - | =

perm ::= r \mid s \mid t \mid w \mid x \mid X \mid u \mid g \mid o
The perm symbols represent the portions of the mode bits as follows:

- The read bits.6
- The set-user-ID-on-execution and set-group-ID-on-execution
- bits. The sticky bit.
- The write bits.
- The execute/search bits.
- The execute/search bits if the file is a directory or any of the execute/search bits are set in the original (unmodified) mode. Operations with the perm symbol ``X'' are only meaningful in conjunction with the op symbol ``+'', and are ignored in all other cases.

 The user permission bits in the original mode of the file.
- The group permission bits in the original mode of the
- file
- The other permission bits in the original mode of the file.

ln, link - makes links

```
ln [-Ffhinsv] source_file [target_file]
```

```
update (up)
update [PATH..] Bring changes from the repository into the working copy.

If no revision is given, bring working copy up-to-date with HEAD rev. Else synchronize working copy to revision given by -r.

For each updated item a line will start with a character reporting the action taken. These characters have the following meaning:

A Added, D Deleted, U Updated, C Conflict, G Merged, E Existed
info
info [TARGET[@REV]...] Display information about a local or remote item. Print information about each TARGET (default: '.').

TARGET may be either a working-copy path or URL. If specified, REV determines in which revision the target is first looked up.
 log
 Show the log messages for a set of revision(s) and/or file(s).
log [PATH] Print the log messages for a local PATH (default: '.').
The default revision range is BASE:1.
 log URL[@REV] [PATH...]
            URL[MEY] [PAIH...]

Print the log messages for the PATHS (default: '.') under URL.

If specified, REV determines in which revision the URL is first
looked up, and the default revision range is REV:1; otherwise,
the URL is looked up in HEAD, and the default revision range is
             HEAD:1.
status (stat, st)
 diff [-c M | -r N[:M]] [TARGET[@REV]...]
 Display the changes made to TARGETs as they are seen in REV between
            lay the changes made to TARGETs as they are seen in RFV between two revisions. TARGETs may be all working copy paths or all URLs. If TARGETs are working copy paths, N defaults to BASE and M to the working copy; if URLs, N must be specified and M defaults to HEAD. The '-c M' option is equivalent to '-r N:M' where N = M-1. Using '-c -M' does the reverse: '-r M:N' where N = M-1.
diff [-r N[:M]] --old=OLD-TGT[@OLDREV] [--new=NEW-TGT[@NEWREV]] [PATH...]
Display the differences between OLD-TGT as it was seen in OLDREV and
NEW-TGT as it was seen in NEWREV. PATHs, if given, are relative to
OLD-TGT and NEW-TGT and restrict the output to differences for those
```

CSSE2310 Important Bash Commands sheet [Chat]

UQAttic

ln [-Ffhinsv] source_file ... target_dir

In [-Ffhinsy] source_file ... target_dir
link source_file target_file
The ln utility creates a new directory entry (linked file) which has the
same modes as the original file. It is useful for maintaining multiple
copies of a file in many places at once without using up storage for the
'copies'; instead, a link 'points' to the original copy. There are
two types of links; hard links and symbolic links. How a link
'points' to a file is one of the differences between a hard and symbolic link holic link.

Create a symbolic link

rm, unlink - remove directory entries

rm [-dfiPRrvW] file ... unlink file

The rm utility attempts to remove the non-directory type files specified on the command line. If the permissions of the file do not permit writing, and the standard input device is a terminal, the user is prompted (on the standard error output) for confirmation.

recursive Force (no confirmation)

- make directories

 $\label{eq:mkdir} \mbox{Mkdir [-pv] [-m mode] directory_name} \ \dots$ The mkdir utility creates the directories named as operands, in the order specified, using mode rwxrwxrwx (0777) as modified by the current

rmdir removes directories

 $\label{eq:rmdir} \textit{rmdir} \ [\text{-p}] \ \textit{directory} \ \dots$ The rmdir utility removes the directory entry specified by each directory argument, provided it is empty.

Arguments are processed in the order given. In order to remove both a parent directory and a subdirectory of that parent, the subdirectory must be specified first so the parent directory is empty when rmdir tries to remove it

- copy files

cp [-R [-H | -L | -P]] [-fi | -n] [-apvX] source_file target_file cp [-R [-H | -L | -P]] [-fi | -n] [-apvX] source_file... target_directory In the first synopsis form, the cp utility copies the contents of the source_file to the target_file. In the second synopsis form, the con-

tents of each named source_file is copied to the destination

tents of each named source_file is copied to the destination target_directory. The names of the files themselves are not changed. If cp detects an attempt to copy a file to itself, the copy will fail. If source_file designates a directory, cp copies the directory and the entire subtree connected at that point. If the source_file ends in a /, the contents of the directory are copied rather than the directory itself. This option also causes symbolic links to be copied, rather than indirected through, and for cp to create special files rather than copying them as normal files. Created directories have the same mode as the corresponding source directory, unmodified by the process' umask.

In -R mode, cp will continue copying even if errors are detected.

Note that cp copies hard-linked files as separate files. If you need to preserve hard links, consider using tar(1), cpio(1), or pax(1) instead.

- move files

```
mv [-f | -i | -n] [-v] source target
mv [-f | -i | -n] [-v] source ... directory
```

In its first form, the mv utility renames the file named by the source operand to the destination path named by the target operand. This form is assumed when the last operand does not name an already existing directory.

In its second form, mv moves each file named by a source operand to a destination file in the existing directory named by the directory operand. The destination path for each operand is the pathname produced by the concatenation of the last operand, a slash, and the final pathname component of the named file.

vim - Vi IMproved, a programmers text editor

head - output the first part of files

Synopsis

head [OPTION]... [FILE]...

Print the first 10 lines of each FILE to standard output. With more than one FILE,

precede each with a header giving the file name. With no FILE, or when FILE is $\,$ -,

read standard input.

-n (number)

prints the first "n" lines instead of the first 10

Examples

s4258788@moss:~/csse2310/exam\$ head -4 foo

This is a file with more than 10 lines.
I'm not going to include it, you'll just have to trust me on this one.
What? You don't trust me? Well too bad, so sad. Monkey see, monkey do

s4258788@moss:~/csse2310/exam\$ head bar I think this file has a few less than ten lines. Yep! and I can prove it

s4258788@moss:~/csse2310/exam\$ head -2 foo bar

This is a file with more than 10 lines.

I'm not going to include it, you'll just have to trust me on this one.

I think this file has a few less than ten lines.

Yep! and I can prove i

s4258788@moss:~/csse2310/exam\$ grep and foo | head

and why did he want a face?
well... i can tell you and i won't feel too bad or sad
or mad or mad and sand

like a sand castle or a jumping castle that is bouncy and fun

tailf-1

Look at head and reverse it.

cut [-f-d]

cut - remove sections from each line of files

Synopsis

cut OPTION... [FILE]...

Print selected parts of lines from each FILE to standard output.

-f, --fields=LIST

select only these fields; also print any line that contains no delimiter character, unless the -s option is specified

-d, --delimiter=DELIM

use DELIM instead of TAB for field delimiter

Examples

(Not really sure on this one, sorry)

A file x.cols has columns separated by \S^* . Output the second column of x.cols -> cut -d \S^* -f 2

A file nums consists of 4 space separated columns. Output columns 1, 3, 4 sorted by the last column cut -d ' '-f1,3,4 nums | sort -k 3

sort -k 4 nums | cut -d' ' -f1,3,4 OR

cat nums | cut -d' ' -f1,3,4 | sort -k 3

Compiled by Ethan Christie 17/4/2012

diff

Synopsis diff [OPTION]... FILES

Description

diff - compare files line by line

Examples

s4258788@moss:~/csse2310/exam\$ cat foo these files are almost the same

but not quite.

something is different

s4258788@moss:~/csse2310/exam\$ cat bar

These files are almost the same But something is a little different

These files are completely

s4258788@moss:~/csse2310/exam\$ cat baz

and utterly identical Seriously, one is a direct copy of the other

s4258788@moss:~/csse2310/exam\$ cat faz

These files are completely and utterly identical Seriously, one is a direct copy of the other

s4258788@moss:~/csse2310/exam\$ diff foo bar

1,3c1,2 < these files are almost the same < but not quite. < something is different

> These files are almost the same. > But something is a little different

s4258788@moss:~/csse2310/exam\$ diff faz baz s4258788@moss:~/csse2310/exam\$

wc [-l]

wc - print newline, word, and byte counts for each file

Synopsis

wc [OPTION]... [FILE]...

Print newline, word, and byte counts for each FILE, and a total line if more than one FILE is specified. With no FILE, or when FILE is -, read standard input.

-l. --lines

print the newline counts

Examples

s4258788@moss:~/csse2310/exam\$ wc foo 19 100 469 foo

s4258788@moss:~/csse2310/exam\$ wc foo -l

s4258788@moss:~/csse2310/exam\$ wc foo bar baz -l

3 bar

1 baz 23 total

Compiled by Ethan Christie 17/4/2012

chmod [all major options]

chmod - change file mode bits

Synopsis

chmod [OPTION]... MODE[,MODE]... FILE...

Description

chmod changes the file mode bits of each given file according to mode, which can be either a symbolic representation of changes to make, or an octal number representing the bit pattern for the new mode bits.

+ adds em, - takes em away!

A combination of the letters **ugoa** controls which users' access to the file will be changed:

- u the user who owns it
- g other users in the file's group
- o other users not in the file's group

The letters rwxXst select file mode bits for the affected users:

- r read
- w write
- x execute (or search for directories)
- X x only if the file is a directory or already has execute permission for some user
- s set user or group ID on execution
- t restricted deletion flag or sticky bit

A numeric mode is from one to four octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. Omitted digits are assumed to be leading zeros.

First digit - Set user ID(4), Set group ID(2), restricted deletion or sticky attributes(1)

Second digit - Select permissions for user who owns the file. Read(4), write(2), execute(1)

Third digit - Select permissions for other users in the file's group. Same values ^

Fourth digit - Other users not in the file's group. Same values ^

```
-v, --verbose
```

output a diagnostic for every file processed

-c, --changes

like verbose but report only when a change is made

-f, --silent, --quiet

suppress most error messages

-R. --recursive

change files and directories recursively

Examples

s4258788@moss:~/csse2310/exam\$ |s -|

total 0 -rw-r--r-- 1 s4258788 students 0 Apr 17 11:34 foo

s4258788@moss:~/csse2310/exam\$ chmod a-r foo s4258788@moss:~/csse2310/exam\$ Is -I

-- 1 s4258788 students 0 Apr 17 11:34 foo

s4258788@moss:~/csse2310/exam\$ chmod u+rwx foo

s4258788@moss:~/csse2310/exam\$ ls -l total 0

-rwx----- 1 s4258788 students 0 Apr 17 11:34 foo (executables are shown in green)

s4258788@moss:"/csse2310/exam\$ chmod g+wr,o+r foo s4258788@moss:"/csse2310/exam\$ ls -l

total 0

-rwxrw-r-- 1 s4258788 students 0 Apr 17 11:34 foo

s4258788@moss:~/csse2310/exam\$ chmod 777 foo

s4258788@moss:~/csse2310/exam\$ |s -|

rwxrwxrwx 1 s4258788 students 0 Apr 17 11:34 foo

s4258788@moss:~/csse2310/exam\$ chmod 0 foo s4258788@moss:~/csse2310/exam\$ ls -l

- 1 s4258788 students 0 Apr 17 11:34 foo

Compiled by Ethan Christie 17/4/2012

rm [-rf]

rm - remove files or directories

Synopsis

rm [OPTION]... FILE...

Description

rm removes each specified file. By default, it does not remove directories.

-f. --force

ignore nonexistent files, never prompt. Remove all files whether write protected or not.

-r, -R, --recursive

remove directories and their contents recursively

s4258788@moss:"/csse2310/exam\$ Is
1file 2file 3file onedir twodir
s4258788@moss:"/csse2310/exam\$ Is onedir/

s4258788@moss:~/csse2310/exam\$ rm 3file s4258788@moss:~/csse2310/exam\$ Is 1file 2file onedir twodir

s4258788@moss:~/csse2310/exam\$ rm onedir rm: cannot remove 'onedir': Is a directory

s4258788@moss:~/csse2310/exam\$ rm -r onedir

s4258788@moss:~/csse2310/exam\$ Is

s4258788@moss:~/csse2310/exam\$ rm -f twodir/

rm: cannot remove 'twodir/': Is a directory

s4258788@moss:~/csse2310/exam\$ dir 1file 2file twodir

s4258788@moss:~/csse2310/exam\$ chmod a-w 1file 2file s4258788@moss:~/csse2310/exam\$ rm 1file rm: remove write-protected regular empty file `1file'? y

s4258788@moss:~/csse2310/exam\$ rm -f 2file s4258788@moss:~/csse2310/exam\$ Is

ln [-s]

In - make links between files

Synopsis

In [OPTION]... TARGET (2nd form)

In [OPTION]... TARGET... DIRECTORY (3rd form)

Description

In the 2nd form, create a link to TARGET in the current directory. In the 3rd and 4th forms, create links to each TARGET in DIRECTORY. Create hard links by default, symbolic links with --symbolic. When creating hard links, each TARGET must exist. Symbolic links can hold arbitrary text; if later resolved, a relative link is interpreted in relation to its parent directory.

-s. --symbolic

make symbolic links instead of hard links

Examples

s4258788@moss:~/csse2310/exam\$ ls

foo mydir (directories are dark blue) s4258788@moss:~/csse2310/exam\$ Is mydir/

bar baz foo nesteddir s4258788@moss:~/csse2310/exam\$ ls mydir/nesteddir/

s4258788@moss:~/csse2310/exam\$ cat mydir/baz this is a file with one line in it

s4258788@moss:~/csse2310/exam\$ In mydir/baz baz-link

s4258788@moss:~/csse2310/exam\$ cat baz-link this is a file with one line in it

s4258788@moss:"/csse2310/exam\$ In -s mydir/nesteddir/ nesteddir-link s4258788@moss:"/csse2310/exam\$ Is baz-link foo mydir nesteddir-link (symbolic links are cyan) s4258788@moss:"/csse2310/exam\$ touch nesteddir-link/mynewfile

s4258788@moss:~/csse2310/exam\$ Is mydir/nesteddir/myfile mynewfile

s4258788@moss:~/csse2310/exam\$ rm -rf mydir/nesteddir/

s4258788@moss:~/csse2310/exam\$ Is nesteddir-link/

s4258788@moss:~/csse2310/exam\$ rm -rf mydir/*

s4258788@moss:~/csse2310/exam\$ ls

baz-link foo mydir nesteddir-link (a symbolic link with a non-existent destination (I removed it!))

s4258788@moss:~/csse2310/exam\$ cat baz-link this is a file with one line in it

s4258788@moss:~/csse2310/exam\$ Is mydir/

Compiled by Ethan Christie 17/4/2012

mkdir

mkdir - make directories

Synopsis

mkdir [OPTION]... DIRECTORY...

Description

Create the DIRECTORY(ies), if they do not already exist.

Examples

s4258788@moss:~/csse2310/exam\$ |s

s4258788@moss:~/csse2310/exam\$ mkdir mydir s4258788@moss:~/csse2310/exam\$ ls

mydir twodir

rmdir

rmdir - remove empty directories

Synopsis

rmdir [OPTION]... DIRECTORY...

Description

Remove the DIRECTORY(ies), if they are empty.

Examples

s4258788@moss:~/csse2310/exam\$ ls

twodir s4258788@moss:~/csse2310/exam\$ is twodir/

s4258788@moss:~/csse2310/exam\$ rmdir twodir/rmdir: failed to remove `twodir/': Directory not empty

s4258788@moss:~/csse2310/exam\$ rm -f twodir/* s4258788@moss:~/csse2310/exam\$ rmdir twodir/

s4258788@moss:~/csse2310/exam\$ Is

s4258788@moss:~/csse2310/exam\$

```
cp [-r]
```

cp - copy files and directories

Synopsis

cp [OPTION]... [-T] SOURCE DEST

cp [OPTION]... SOURCE... DIRECTORY

cp [OPTION]... -t DIRECTORY SOURCE...

Description

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY.

copy directories recursively

Examples

s4258788@moss:~/csse2310/exam\$ Is 1dir 2dir bar foo s4258788@moss:~/csse2310/exam\$ cat foo

this file

s4258788@moss:~/csse2310/exam\$ cp foo ./2dir s4258788@moss:~/csse2310/exam\$ Is 2dir/

s4258788@moss:~/csse2310/exam\$ cat 2dir/foo

this file has two lines ... NOT!

s4258788@moss:~/csse2310/exam\$ ls 1dir/

apple banana orange s4258788@moss:~/csse2310/exam\$ cp -r 1dir/ 2dir/

s4258788@moss:~/csse2310/exam\$ Is 2dir/ 1dir foo

s4258788@moss:~/csse2310/exam\$ Is 2dir/1dir/

apple banana orange

UNIX File Permissions

UQAttic [Chat]

An example of the output produced by 'ls -l' is shown below.

drwx	2	richard richard	staff staff	2048 2048	Jan 2 1997 Jan 2 1997	private admin
-FW-FW	2	richard	staff	12040	Aug 20 1996	admin/userinfo
drwxr-xr-x	3	richard	user	2048	May 13 09:27	public

Field 1: a set of ten permission flags.

Field 2: link count
Field 3: owner of the file
Field 4: associated group for the file
Field 5: size in bytes

Field 6-8: date of last modification (format varies, but always 3 fields)
Field 9: name of file (possibly with path, depending on how Is was called) The permission flags are read as follows (left to right)

position	Meaning				
1	directory flag, 'd' if a directory, '-' if a normal file, something else occasionally may appear here for special devices. 'l' indicated a link				
2,3,4	read, write, execute permission for User (Owner) of file				
5,6,7	read, write, execute permission for Group				
8,9,10	read, write, execute permission for Other (Other meaning NOT in user or group)				
value	Meaning				
-	in any position means that flag is not set				
r	file is readable by owner, group or other. If set on a directory, you can list the directory contents.				
w	file is writeable. On a directory, write access means you can add or delete files				
x	file is executable (only for programs and shell scripts - not useful for data files). Execute permission on a directory means you can traverse the directory.				
s	in the place where 'x' would normally go is called the set-UID or set-groupID flag.				

On an executable program with set-UID or set-groupID, that program runs with the effective permissions of its owner or group.

For a directory, the set-groupID flag means that all files created inside that directory will inherit the group of the directory. Without this flag, a file takes on the primary group of the user creating the file. This property is important to people trying to maintain a directory as group accessible. The subdirectories also inherit the set-groupID property.

Linux Read mode permissions

- Read access on a file allows you to view file
- Read access on a file allows you to view tile
 Read access on a directory allows you to view directory contents with Is command.

Write mode permissions

- Write access on a file allows you to write to file
- Write access on a directory allows you to remove or add new files

Execute mode permissions

Execute access on a file allows to run program or script

Execute access on a directory allows you access file in the directory

mv - move (rename) files

Synopsis

mv [OPTION]... [-T] SOURCE DEST mv [OPTION]... SOURCE... DIRECTORY

mv [OPTION]... -t DIRECTORY SOURCE...

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY.

Examples

s4258788@moss:~/csse2310/exam\$ Is bar foo thatdir thisdir

s4258788@moss:~/csse2310/exam\$ mv foo foobar s4258788@moss:~/csse2310/exam\$ ls bar foobar thatdir thisdir

s4258788@moss:~/csse2310/exam\$ mv foobar thatdir/ s4258788@moss:~/csse2310/exam\$ Is thatdir/

s4258788@moss:~/csse2310/exam\$ |s

s4258788@moss:~/csse2310/exam\$ mv thatdir/foobar ./foo s4258788@moss:~/csse2310/exam\$ Is

har foo thatdir thisdir

s4258788@moss:~/csse2310/exam\$ is thatdir/ s4258788@moss:~/csse2310/exam\$
